                                                                                                                                                                                                                                                                    NAL. SERUCE, BIOL. 9:750-755 (2002).

-I. FUNCTION: BINDS TOGETHER WITH $18 TO 16S RIBOSOMAL RNA.

-I. FUNCTION: BINDS TOGETHER WITH $18 TO 16S RIBOSOMAL RNA.

-I. FUNCTION: BINDS TOGETHER WITH $18 TO 16S RIBOSOMAL RNA.

-I. FUNCTION: BINDS OF THE PORMS OF THE PROTEIN, VARYING ONLY IN THE NUMBER SEQUENCE SHOWN IS FORM $6-6, WHICH IS THE LONGEST. THE FIRST 2 GLU ARE ENCODED BY THE RAPE FORD, THE OTHER GLU ARE ADDED FOST-

TRANSLATIONALLY BY THE RIMK ENZYME.

-I. MASS SPECTROMETRY: WW-118187.2, METHOD-WALDI; RANGE=1-131.

-I. SIMILARITY: BELONGS TO THE $6P FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pfam; PF01250; Ribosomal_S6; 1.

Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.

I- FUNCTION: BIOTRANSFORMATION ENZYME THAT CATALYZES THE HYDROLYSIS
OF EPOXIDES (ALKENE OXIDES, OXIRANES) AND ARENE OXIDES TO LESS
REACTIVE AND MORE WATER SOLUBLE DIHYDRODIOLS BY THE TRANS ADDITION
OF WATER (BY SIMILARITY: AN EPOXIDE + H(2)O = A GLYCOL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            01-DEC-2001 (TrEMBLrel. 19, Created)

                                                                                  Sequence 2, Application US/09150741

Patent No. 618396

GENERAL INFORMATION:

APPLICANT: Stewart et al.

TITLE OF INVENTION: Nucleotide Sequence Encoding Carbamoyl Phosphate
Patent No. 6183996

PATENTE OF INVENTION: Synthetase II

FILE REFERENCE:

CURRENT PILING DATE: 1998-09-10

EARLIER APPLICATION NUMBER: US/09/150,741

CURRENT FILING DATE: 1998-10-10

RESULT 10

```
Sequence 15, Application US/09635872A

Patent No. 6534300

GENERAL INFORMATION:
HILLIAM

TITLE OF INVENTION: METHODS FOR PRODUCING HIGHLY PHOSPHORYLATED LYSOSOWAL HYDROLASES
FILE REPERENCE: 195613US0

CURRENT APPLICATION NUMBER: US/09/635,872A

CURRENT APPLICATION NUMBER: 60/153,831

PRIOR FILING DATE: 1999-09-14

NUMBER OF SEQ ID NOS: 52

SOFTWARE: PatentIn version 3.0

SEQ ID NO 15

LENGTH: 908
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 19826, Application US/09252991A
Fatent No. 6551795
GENERAL INFORMATION:
APPLICANT: MARCI O. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS:
TITLE OF INVENTION: AERCHGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 107196.136
CURRENT FILING DATE: 1999-02-18
FRIOR FILING DATE: 1999-02-18
FRIOR FILING DATE: 1998-02-18

Patent No. 6562958

GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER

TITLE OF INVENTION: NUMBER: US/09/328,352

CURRENT APPLICATION NUMBER: US/09/328,352

CURRENT FILING DATE: 1999-06-04

Sequence 25132, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERABEUTICS

FILE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT PILING DATE: 1999-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

Zinc-dependent alcohol dehydrogenase - Helicobacter pylori (strain J99)
C.Species: Helicobacter pylori
A;Variety: strain J99 |
A;Variety: strain J99 |
B;Variety: strain J99 |
A;Molecule,type: DNA
A;Residues: 1.348 <TOM>
A;Cross-references: GB:AE000617; GB:AE000511; NID:g2314256; PIDN:AAD08150.1; PID:g231425
C;Superfamily: alcohol dehydrogenase; long-chain alcohol dehydrogenase homology
C;Keywords: alcohol metabolism; metalloprotein; oxidoreductase; zinc
C;Keywords: alcohol metabolism; dehydrogenase homology <LADH>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A;Cross-references: GB:AE001531; GB:AE001439; NID:g4155617; PIDN:AAD06610.1; PID:g415562

contracted in vitro or in vivo in the presence and at the expense of an antigen presenting cell that presents the immunogenic compound in the contract of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune effector cell. The compounds are useful for modulating an immune response to the synthetic and naturally occurring compounds. The compounds are especially useful in gene therapy or as components of anti-cancer vaccines. The compounds are also useful for generating antibodies that specifically recognise and bind to these molecules. These artibodies are further useful for immunotherapy when administered to a subject. The peptides, polypeptides and polynucleotides are useful in immunotherapy when administered to a subject: methods, for the detection and purification of antibodies, or as immunogens for the production of antibodies. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigen ATF4/CREB-2 (not defined) and the polynucleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune responses in a subject by delivering the compound, a method of immunotherapy comprising administering to a subject the antibody, an immune effector cell that has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: Immunogenic ligands AAU74681-AAU74686 are stated to be encoded by the degenerate DNA sequences AAS20120-AAS20125 respective) but have not been cross-referenced or CDS features put in due to the

                                                                                                                                                                                                                                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; cancer antigen; ATF4; CREB-2; vaccine; cytostatic; immunogenic ligand; gene therapy; MHC; major histocompatibility complex; adoptive immunotherapy; cancer; ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigen ATF4/CREB-2 (not defined) and the polynucleotides encoding them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed
specification, but was obtained in electronic format directly from WIPO
                                                                                        New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New therapeutic compounds comprising immunogenic ligands, useful for modulating an immune response, particularly for treating ovarian cancer, and as components of anticancer vaccines

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The B. mori silkworm larvae derived (pro)phenoloxidases Phe52-Val693 (AAR89114) and Phe52-Gly685 (AAR89115), are encoded by AAT10240 and AAT10241, respectively. The (pro)phenoloxidases can be used as new labelling oxidases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (Pro)phenol:oxidase from silkworm - useful as a labelling oxidase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Silkworm; larvae; pro; phenoloxidase; Phe52-Val693; Phe52-Gly685
                                                                                                                                                                                                                      Length 683;

                                         administering to a subject the antibody, an immune effector cell that has been raised in vitro or in vivo in the presence and at the expense of an antigen presenting cell that presents the immunopenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy comprising administering the immune effector cell. The compounds are useful for modulating an immune response to the synthetic and naturally occurring compounds. The compounds are useful for modulating an immune response especially useful in gene therapy or as components of anti-cancer vaccines. The compounds are useful for treating cancer, particularly ovacines. The compounds are also useful for generating antibodies are further useful for immunotherapy when administered to a subject. The peptides, polypeptides and polymuleschides are useful in
Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising
                                                                                                                                                                                                                                                  diagnostic methods, for the detection and purification of antibodies, or as immunogens for the production of antibodies. The present sequence represents a human cancer antigen ATF4/CREB-2 based immunogenic

G protein-coupled receptors termed nGPCR-x. nGPCR-x polynucleotides, polypeptides, and modulators may be used in the treatment of diseases and conditions such as infections, such as vival infections caused by HIV-1 (human immunodeficiency virus) or HIV-2, pain, cancers, metabolic and cardiovascular diseases and disorders (e.g., type 2 diabetes, obesity, annotexia, hypotension, hypertension, myocardial infarction, atherosclerosis), Parkinson's disease, and psychotic and neurological disorders, including schizophrenia, migraine, major depression, anxiety, mental disorder, mannic depression, and dyskinesias, such as Huntington's disease or Tourette's Syndrome and many other diseases and syndromes listed in the specification. nGPCR-x polynucleotides and polypeptides, as well as nGPCR-x modulators, may also be used in diagnostic assays for such diseases or conditions. The present sequence represents a G protein-coupled receptor
                                                                                                                                                                                      Human; G protein-coupled receptor; nGPCR-x; antiviral; analgesic; cytostatic; cardiant; antidiabetic; anoretic; hypotensive; hypertensive; antiparkinsonian; noctropic; neuroprotective; antidepressant; viral infection; HIV-1; human immunodeficiency virus; HIV-2; pain; cancer; metabolic disease; cardiovascular disease; type 2 diabetes; obesity; anorexia; hypotension; hypertension; mycardial infarction; atherosclerosis; Parkinson's disease; psychosis; neurological disorder; schizophrenia; migraine; major depression; anxiety; mental disorder; manic depression; dyskinesia; Huntington's disease; Tourette's Syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel isolated nucleic acid molecules encoding

The nGPCR-x can be used for screening compounds which can be used to treat mental disorders, thyroid disease, renal failure, inflammatory conditions such as Crohn's disease, rheumatoid arthritis, autoimmune disorders, schizophrenia, migraine, stroke, dementia, depression, Parkinson's disease, Alzheimer's disease, and Huntington's disease. They may also be used for treating viral infections such as human immunodeficiency virus (HIV), type 2 diabetes, obesity, anorexia, hypotension, hypertension, thrombosis, myocardial infarction,
                                                                                                                                                                                                                                                                                                                                                                Human; mental disorder; thyroid disease; renal failure; anorexia; inflammatory condition; Crohn's disease; rheumatoid arthritis; HIV; autoimmune disorder; schizophrenia; migraine; stroke; dementia; obesity; depression; Parkinson's disease; Alzheimer's disease; viral infection; thutington's disease; human immunodeficiency virus; type 2 diabetes; anorexia; hypotension; hypetrenion; thrombosis; myocardial infarction; atherosclerosis; cancer; sexual dysfunction; G protein-coupled receptor;
                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value sequences are selected of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
atherosclerosis, cancer, and sexual dysfunction. AAU25617-AAU25726 represent the amino acid sequences of novel human G protein-coupled receptors, nGPCR-2031 to nGPCR-2140 respectively, as described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                        .

New therapeutic compounds comprising immunogenic ligands, useful for modulating an immune response, particularly for treating ovarian cancer, and as components of anticancer vaccines

```
The invention relates to compounds comprising an immunogenic ligand whose sequence is based in part on residues 42-50 of human cancer antigon ATF4(FRB-2 (not defined) and the polynucleotides encoding them. Also included are an antibody that specifically recognises and binds the compound, a method for inducing an immune response in a subject by delivering the compound, a method of immunotherapy comprising cadministering to a subject the antibody, an immune effector cell that has been raised in vitro or in vivo in the presence and at the expense of an entition presenting cell that presents the immunogenic compound in the context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy compunies the immune response of context of an MHC (major histocompatibility complex) molecule and a method of adoptive immunotherapy compounds. The compounds are useful for modulating an immune response of the synthetic and naturally occurring compounds. The compounds are useful for treating cancer, particularly covarian cancer. The compounds are also useful for generating antibodies that specifically recognise and bind to these molecules. These compounds are also useful for generating antibodies chart specifically recognise and bind to these molecules. These cusptides are also useful for antibodies are useful in diagnostic methods, for the detection and purification of antibodies. The present correct antigen ATF4(CRBP-2 based immunogenic interview) is an antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. Nad P may be used in the prevention, adaquosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, inscring the nucleic acids into a host cell and culturing the cell color express the proteins. N and P can be used in the prevention, diagnosis and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding 4277 human colon cancer-associated polypeptides,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                can be used in forensic, gene therapy and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or importing a polypeptide into a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAX40438 to AAX40715 represent 5' expressed sequence tags (ESTs) for human secreted proteins expressed in prostate, and encode the proteins given in AAV17191 to AAV11993 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation and differentiation activity, haematopoissis regulating activity, tissue growth regulating activity, nemestatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, tumour inhibition activity or other activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated prostate-derived nucleic acids - used to develop products which may have cytokine, immune regulatory, haematopoiesis regulating, anti-inflammatory or tumour inhibition activity

Drmanac RT; Liu C, rang YT,

WPI; 2001-457740/49. N-PSDB; ABA08513 Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer

Claim 20; Page 161; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the bind the invention have homology to known proteins, thereby giving a insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may differentiation activities, including cytokine, cell proliferation or cell differentiation activities, stem cell growth activity; chamalopolesis regulatory activity; tissue growth activity; chemocallatory activity, activity; tissue growth activity; chemocallatory activities, receptor or inhibin-related activities; chemocallatory activities, neceptor or ligand activities, or may be involved in oncogenesis, cancer cell proliferation or metastasis. Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating contitions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., wyploid or lymphoid or lymphoid call disease, haematopoletic disorders (e.g., wyploid or lymphoid or arthritis), arthritish partial isthermed therefore or arthritish proliferative retainpathy, atherosclerosis, coronary heart disease, arthritish partial isthermed. arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells

ö
that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGIT6-ABLIGOT1), expressed DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

```
The present invention relates to the genome sequence of Listeria

monocytogenes EGD-e (see ABA03041). The genome sequence and fragments of
it are useful for selecting probes and primers for detecting genes in L.

compocytogenes and related organisms, and for studying genes in L.

monocytogenes and related organisms, and for studying genes in L.

compocytogenes and related organisms, and for studying genetic

compocytogenes and cher genomes. The present invention. Proteins

compocytogenes and proteins

compositions of L. monocytogenes and related organisms, and

compositions that regulate gene expression and cell replication

compocytogenes and proteins encoded by it are also useful for

sequence and proteins encoded by it are useful in pharmaceutical and

compocytogenes and related diseases. In addition, the genome

compocytogenes and related organisms.

compocytogenes and related organisms.

compocytogenes and related organisms of the printed in pharmaceutical and

compocytogenes and related organisms.

compocytogenes and related organisms.

compocytogenes and related organisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Patent No. 6380370

Patent No. 6380370

Patent No. 6380370

APPLICANT: INFORMATION:
APPLICANT: Lynn Doucette-Stamm et al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO STAPHYLOCOCCUS
FILE REFERENCE: GTC-007

CURRENT APPLICATION NUMBER: US/09/134,001C

CURRENT APPLICATION NUMBER: US 60/064,964

PRIOR PAPLICATION NUMBER: US 60/064,964

PRIOR APPLICATION NUMBER: US 60/055,779

PRIOR APPLICATION NUMBER: US 60/055,779
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 11, Application US/09632947B

Patent No. 6556845

GENERAL INCORMATION:
APPLICANT: Pharmacia & Upjohn

TITLE OF INVENTION: CRYSTALLIZATION AND STRUCTURE DETERMINATION OF

TITLE OF INVENTION: UDP-N-ACETYLENOLPYRUVYLGLUCOSAMINE REDUCTASE (S. aureus
TITLE OF INVENTION: MAID)

FILE REFERENCE: 268.6241 0101

CURRENT APPLICATION NUMBER: US/09/632,947B

Sequence 5771, Application US/09328352
Patent No. 6562958
GENERAL INFORMATION:
APPLICANT: Gary L. Breton et al.
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: GTC99-03P8. US/09/328,352
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-66-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 5771
LENGTH: 539
 TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 107196.136
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR PILING DATE: 1998-07-18
PRIOR PILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
SEQ ID NO 25679
LENGTH: 452
